**Enclosure Classification**

**Test for Enclosed Building:** A building that does not qualify as open or partially enclosed.

**Test for Open Building:** All walls are at least 80% open.  
 $A_o \geq 0.8A_g$

**Test for Partially Enclosed Building:**

| Input |        | Test                        |     |
|-------|--------|-----------------------------|-----|
| Ao    | 0.0 sf | $A_o \geq 1.1A_{oi}$        | YES |

| Agi   | 0.0 sf |                             |     |

Building is NOT Partially Enclosed.

Conditions to qualify as Partially Enclosed Building. Must satisfy all of the following:

- Ao >= 1.1Aoi
- Ao > smaller of 4' or 0.01 Ag
- Aoi / Agi <= 0.20

Where:

- Ao = the total area of openings in a wall that receives positive external pressure.
- Ag = the gross area of that wall in which Ao is identified.
- Aoi = the sum of the areas of openings in the building envelope (walls and roof) not including Ao.
- Agi = the sum of the gross surface areas of the building envelope (walls and roof) not including Ag.

**Reduction Factor for large volume partially enclosed buildings (Ri) :**

If the partially enclosed building contains a single room that is unpartitioned , the internal pressure coefficient may be multiplied by the reduction factor Ri.
